# Lorimer

**Lorimer is a high yielding, early maincrop crisping variety.**

It is resistant to PCN (G. Rostoch), splitting, potato virus A, skin spot and spraing. This variety also shows moderate resistance to late blight, common scab and leaf roll virus.

In common with its Olympus parent, it exhibits strong resistance to low temperature sweetening. This results in pale fry colours being maintained throughout a long storage period. A related feature is a very low level of acrylamide produced during processing.

Description	
Origin	Olympus x 98-HIG-16.4
Maturity	Early Maincrop
Tubers	Round oval tubers, white skin, cream flesh
Consumer Quality	High dry matter variety suitable for crisp production
Agronomic Features	Low input requirements and ideal for long term storage

Diseases, Pests and Damage			
Late Blight	5	External Damage	7
Blackleg	5	PVA	8
Common scab	6	Leaf roll	5
PCN (G. Rostoch 1)	9	Skin spot	7
		Spraing	9

Note : Scale of 1-9. High numbers equate to high resistance, low numbers equate to low resistance to pathogens or pests.
